Solutions available here. Homework #11 (due Friday, April 22). Do all the exercises from part 2 and the first 6 exercises from part 3 of the lecture notes on differential forms. Solutions to the problems on part 2 of the notes available here. Solutions to the questions from part 3 are available here. Homework #12 (due Friday, April 29).

### Differential Topology Homework

Differential topology considers the properties and structures that require only a smooth structure on a manifold to be defined. Smooth manifolds are 'softer' than manifolds with extra geometric structures, which can act as obstructions to certain types of equivalences and deformations that exist in differential topology.

## **Differential topology - Wikipedia**

The development of differential topology produced several new problems and methods in algebra, e.g., so-called stable algebra, the method of formal groups, etc., and also in the theory of partial differential equations and dynamical systems, functional analysis and geometry.

## **Solution Of Differential Topology By Guillemin Pollack ...**

The differential topology aspect of the book centers on classical, transversality theory, Sard's theorem, intersection theory, and fixed-point theorems. The construction of the de Rham cohomology builds further arguments for the strong connection between the differential structure and the topological structure.

Other articles where Differential topology is discussed: topology: Differential topology: Many tools of algebraic topology are well-suited to the study of manifolds. In the field of differential topology an additional structure involving “smoothness,” in the sense of differentiability (see analysis: Formal definition of the derivative), is imposed on manifolds.

Solution. (a) By the cellular definition of Euler characteristic, we can count the number of  $k$ -cells in  $X^2$ , where  $k = 0, 1, 2$ , and take the alternating sum. Regarding  $X^2$  as  $[v_0, \dots, v_4]$ , each  $k$ -cell is determined uniquely by choosing  $k$  of the vertices in any order. Therefore the number of  $k$ -cells is  $\binom{5}{k}$ . So  $c(X^2) = \binom{5}{0} - \binom{5}{1} + \binom{5}{2} = 1 - 5 + 10 = 6$ .

If  $f: M \rightarrow M$  is a diffeomorphism, and  $f(p) = p$ , i.e.  $p$  is a fixed point, then the differential of  $f$  at  $p$  is a well defined  $m \times m$  matrix (up to conjugacy). Show that the graph of  $f$  is transverse to the diagonal in  $M \times M$  if and only if  $1$  is not a singular value of this matrix, i.e. if  $I - Df_p$  is non-singular. Homework #3. 1.
